

Multiple plots of the nitrite spot check data vs. time, for the period 1995 – present as measured in the incoming water to the Monterey Bay Aquarium drawn from a ~50ft depth. Each of the following pages contains a 10-year period of the data, with the monthly mean \pm standard error of the spot checks being presented. Nitrite was analyzed using the method outlined with this project. Both short-term seasonal changes and longer-term events, such as El Nino, are present in the data.

For questions or to gain access to the data archive please contact either Roger Phillips (rphillips@mbayaq.org) or Eric Kingsley (ekingsley@mbayaq.org) at the Monterey Bay Aquarium.

Monterey Bay Aquarium Incoming Seawater, 1995 - 2004
